

SIR OTONDE MICHAEL AWITI

TOPIC1: (Introduction to Cataloguing)

1.0 Introduction

It is necessary to understand the meaning of Bibliographic Control so as to have a clear picture and application of cataloguing principles and practice thus;

1.1 Bibliographic Control: definition

- Bibliographic control can be defined as the process of creating and managing of bibliographic records each of which contains enough information to identify an item. B.C further includes arranging and providing access to the items represented by the records.
- Bibliographic control also refers to the skill or art of organizing knowledge for information retrieval. It can be described as the process of maintaining bibliographic records and the system that enables users to access them.
- The Components of Bibliographic Control are also referred to as **bibliographic tools** and they include bibliographies, indexes, bibliographic databases, registers etc. The term bibliographic control further refers to the operations by which recorded information is organized or arranged according to established standards and thereby made readily retrievable.
- In library and information science, **bibliographic control (also known as information organization or bibliographic organization)** is the process by which information resources are described so that users are able to find and select that information resource. In this regard, an information resource could be a book, a movie, or an image, among other things. By providing a name, title, and subject access to the description, a bibliographic record is created.

1.2 Basic Definition of a Catalogue and Related terms

- **Catalogue**

A catalogue is simply a list of the holdings in a library/information centre arranged according to subject, title, or author. **S.R. Ranganathan** further defines a catalogue as **a tool which gives information about the contents of the library.**

- **Bibliography**

SIR OTONDE MICHAEL AWITI

A bibliography is a list of books or other information materials on one particular subject referred to in another article.

- **Index**

An index is an alphabetical list of items contained in a book, document or computer memory. Index means ‘**to indicate**’ or ‘**to point out**’ and we all know that at the end of a book there is an exhaustive index showing the list of terms along with the relevant page numbers for instant reference for easy retrieval of the information. Very often the index satisfies the subject approach.

- **Shelf List**

It is an inventory which records bibliographical data of items arranged exactly the same way as arranged on the shelves. Each title is represented by a card mentioning the **author, title, edition, numbers of volumes, number of copies, call number and such other items as necessary**. The call number determines the arrangement of the cards in the shelf list in the exact order of the arrangement of books on the shelves and a reader can easily obtain the needed book from the shelf by this number. **A shelf list thus;**

- i. Serves principally for inventory and control of the collection.
- ii. More or less the shelf list card is a duplicate of the main entry except the exclusion of notes, contents and tracing.
- iii. To some extent, it resembles a classified catalogue i.e. a subject catalogue.
- iv. It is consulted only by staff of the library. Used usually at the time of book selection and stock verification.

- **Accession Register**

It is a very important administrative record in which books either purchased or received through gift and exchange are listed in chronological order date wise and assigned a number sequentially. The record contains the information about author, title, edition, date of publication, publisher, price, source of supply, sometimes the call number and remarks. As it is a date wise record of the collections and arranged according to serial number of the items, it cannot serve as a finding tool about the availability of documents of a library. **In many**

SIR OTONDE MICHAEL AWITI

libraries it also serves as a stock register. To get information from this register, one needs to know the accession number of the document.

- **Access points**

Library catalogues provide access to items by **their author, title, subject, co-author, translator, illustrator, and by series title.** Each author's name, or title, etc. is often referred to as an access point or entry. The catalogue will also provide the call number for each item, so that it may be located on the shelf.

1.4 The objectives and functions of the library catalogue.

- A Catalogue plays a vital role in the society. All business concerns prepare and maintain their catalogues for their successful operation. The Library, as a social institution and service institution also depends upon its catalogue/s for its successful functioning.
- The term "Catalogue" has been formed from a Greek phrase "KATALOGOS". 'KATA' means 'according to' or 'by' and 'LOGOS' means 'word' or 'order' or 'reason'. Thus, the term catalogue may be regarded as a:
 - i. Work in which contents are arranged in a reasonable way.
 - ii. Work which is done on a set plan; and Work whose contents are arranged in a systematic way.

1.4.1 Details of a Library Catalogue

Library catalogue is a list of reading material available in a library. **The list;**

- Contains entries of library materials, arranged according to some definite plan or order. It is confined to the contents of a particular library or collection.
- May be described as a record and a finding list, which identifies traces and locates materials contained in a collection, a library, or group of libraries, arranged according to some definite plan.
- It is an explanatory, logically arranged inventory and key to the library materials and their contents, and differs from a bibliography in being confined to the books in a particular library or libraries

SIR OTONDE MICHAEL AWITI

- May be a recording of information regarding manuscripts, books, pamphlets, musical composition, illustrations, prints, cartographic materials e.g maps, slides, computer files, graphics, realia (three-dimensional objects), CDs, CD-ROMs inter alia.
- A register of all bibliographic items found in a library or group of libraries such as a network of libraries at several locations. A catalogue for a group of libraries is also called a **Union Catalogue**.

1.4.2 A Catalogue according to Charles Ami Cutter

Charles Ami Cutter defined a Catalogue as a list of books which is arranged on some definite plan. **He described the objectives of a library catalogue in 1876 when he published the first edition of his book, “Rules for a Dictionary Catalogue”.** His views on the subject are often quoted and are relevant even today. According to him, a catalogue should;

- i. Enable a person to find a book of which;**
The author, or
The title, or
The subject is known
- ii. Show what the library has;**
By a given author
On a given subject
In a given kind of literature
- iii. Assist in the choice of a book;**
As to its edition (bibliographically)
As to its character (literary or topical).

1.4.3 General Objectives of a Library Catalogue

i). The first objective of a library catalogue is to inform the availability/non availability of a particular reading material in the library, thus;

- The readers may approach the catalogue through the **name of an author or title**.
- **The title entries** in the catalogue cater to the title approach of the readers.
- The **name of the subject** entry in the catalogue furnishes him the requisite information.

ii) The second objective is to show what a library has, thus;

- The catalogue **lists all the works** of a particular author available in the library collection
- The catalogue **lists all the documents available in a given subject or in a given kind of literature**.

SIR OTONDE MICHAEL AWITI

iii) The third objective is to provide what is known as descriptive cataloguing.

- According to the rules of descriptive cataloguing, the characteristics of the documents are fully described so that one document can be identified and isolated from amongst several similar documents.

1.4.4 The Importance of a Library Catalogue in Summary

- It helps in the exploitation of resources of the library.
- It enables users to find a book or any other information resources of which the Author, Title or Subject is known
- It shows what the library has by a given author, on a given subject
- It assists in the choice of a book or any other information resource as it indicates its Edition, and content among other details
- It saves the time of the reader, and of the staff in retrieving information
- It allows the reader to search and locate the books and other information resources without hindrance.
- It is Indispensable tool for other sections of the library like providing reference service.

1.4.5 The Requisites to be Considered When preparing a Functional or Good Library Catalogue.

The requisites are enumerated below;

- **Accuracy:** Errors of spelling and style or format may be avoided. Inaccuracy of any type may lead to misunderstanding, loss of time and even dislocation of a card leading to disappointment to a reader. Cards should be carefully checked before filing.
- **Consistency:** The rules of cataloguing should be strictly adhered to so that consistency can be maintained. If an amendment in rules is required to be made due to some practical exigencies, it may be made only after a careful consideration of all the pros and cons. But once an amendment has been adopted, it should be followed consistently and there should not be after thoughts and frequent changes. All changes should be recorded in a file or on the cataloguing code for future reference and guidance.
- **Needs of Users:** A librarian should always keep the needs of the users in mind while deciding about the various entries in the catalogue. He should keep in mind the type of queries frequently made by the users. The catalogue should be so designed that it is able to satisfy the needs of majority of the users.

SIR OTONDE MICHAEL AWITI

- **Arrangement:** The arrangement of content in an entry should be simple, uniform and easy to understand. It should not confuse the reader but give clear cut guidelines about the nature of the book and its location.
- **Up-to-dateness:** There should be no time gap between acquisition and processing of books and between preparation of catalogue cards and their filing in the catalogue cabinet.
- **Multi-pronged approach:** The cataloguer should try to provide at least a few added entries in order to enable the users to locate a document from various angles i.e. author, title, editor, subject, joint author. The chances of retrieval of documents on demand increase with this multi-pronged approach.
- **According to Ranganathan a Library catalogue should be able to answer the following questions:**
 - i. Is there a book in the library by such and such author? What are all the books in the library by her/him ?
 - ii. Is there a book in the library with such title?
 - iii. Is there a book in the library by a particular editor, translator, reviser, compiler?
 - iv. Is there a book on a specific subject and its sub-divisions?
 - v. Is there a book in a publisher's series in the library?

S.R. Ranganathan has further analysed the objectives in the light of his Five Laws of Library Science (**1.Books are for use 2.Every reader his or her book 3.Every book its reader 4.Save the time of the reader 5. A library is a growing organism**). He stated that the catalogue should be designed so as to:

- Disclose to every reader his or her documents;
- Secure for every document its reader;
- Save the time of the reader; and for this purpose
- Save the time of the staff.

1.4.6 A Cataloguer

- In simple terms, a cataloguer is a library professional who carries out cataloguing of information resources in a library. He or she is responsible for the processes of description, subject analysis, classification, and authority control of library materials. Catalogers organize information in such a way as to make them easily accessible.

SIR OTONDE MICHAEL AWITI

- The cataloguer must be able to work with the new information technologies to develop machine-readable catalogues that can be accessed in remote locations. Cataloguers must come to terms with the idea of the digital library, he should understand that his clientele are no longer those within its immediate environment, but the entire universe of users worldwide, and also make other relevant catalogues in the information world available to his immediate clientele. In the actual sense, the emerging technologies have not threatened the cataloguer's job, but have only added responsibilities and finesse to his job.
- The cataloguer should know his users and their information needs. It is clear that in this information and communication technology age, it is not just about cataloguing; it is cataloguing for the clientele.

1.4.7 Cataloguing

Cataloguing refers to the process of preparing catalogue entries for all materials that are available in the library. These information materials include books, manuscripts, journals, floppy disk, DVD, CD ROMS, audio visual materials such as micro forms (i.e. microfilms, microfiches and micro cards), digital materials, motion pictures, sound recording, graphic materials and cartographic materials. The technical section of the library is where cataloguing (organization, processing, subject analyses and intellectual activities of all the library materials mentioned above are implemented). Through the process of cataloguing, cataloguers are able to individualize each material acquired by the library, by giving them a unique number for proper identification and thus, provide an access point for each. These materials are large in number and are of different nature in various disciplines. Cataloguing and classification are therefore, the major activities of cataloguers

1.4.8 Cataloguing Department

The cataloguing department is a major unit in the library and it is most relevant in this technological age. It is responsible for creation and maintenance of the Online Public Access Catalogue (OPAC) and the manual catalogue in its various forms such as author/title, subject, shelf list, accession list, serials, and authority file catalogues.

SIR OTONDE MICHAEL AWITI

Manual catalogue of many Libraries are now converted to OPAC or WEBPAC (An information retrieval tool that helps you find what is in the Library). It is noteworthy that the whole library operations depend totally on the working environment of cataloguers, as the department is the **nerve centre** of any library. **Cataloguing department is pivotal in meeting the library's main purpose which is to;**

- To provide a supportive and stimulating environment for students and staff in a college or university
- To encourage users to reach their potential in developing a positive attitude for lifelong learning.
- To foster the enjoyment of reading to all members of a community by developing a reading culture.
- To support the school curriculum by providing access to relevant resources for pupils and students.
- To deliver relevant and timely information to users who need the information.
- To promote development of reading culture among learners and the community at large.

LESSON 2: Catalogue Codes, and Their Evolution

2.0 Catalogue Codes, and their evolution

A **catalogue code** means a set of rules with defined terminology designed for cataloguing purposes and rules means single provision to carry out cataloguing work. However, cataloguing cannot be static. They must be allowed to respond to the changing cataloguing needs and hence the need for revisions.

Catalogues have changed dramatically over the centuries, having appeared in **many forms, from clay tablets, papyrus scrolls, printed books and cards, microform, to the online versions used today, thus;**

- **Sir Thomas Bodley's catalogue code for the Oxford University Librar:** **Sir Thomas Bodley (1545-1613)** was an English diplomat and scholar who founded the Bodleian Library in Oxford. He evolved a catalogue code for the Oxford University Library in 17th Century. The **Bodleian Library** is the main research library of the University of Oxford and is one of the oldest libraries in Europe. It derives its name from its founder Sir Thomas Bodley.
- **British Museum Code (1841):** The earliest code of cataloguing which has exerted considerable influence over the subsequent codes is Panizzi's 91 rules printed as prefatory matter in the British Museum Catalogue of 1841. In 1841 Antonio Panizzi, Keeper of the Department of Printed Books at the British Museum (now the British Library), **issued 91 Rules for Compilation of the Catalogue**. These rules represented the first rigorous and thorough attempt to standardize cataloguing of printed books, maps and music in order to compile the catalogue of the same.
- **Charles C. Jewett Code (1852):** The American libraries seriously considered the need to bring out a code of cataloguing rules. Jewett, Librarian of the Smithsonian Institute prepared a code of 39 rules in 1852.
- **Cutter's Rules (1876):** Charles Ammi Cutter's published Rules for a Dictionary Catalogue (RDC) containing 205 rules from Washington. These were considered the standard for dictionary catalogue. Charles Cutter (1837-1903) was another pioneering librarian. One part of his large body of work was Rules for a Printed Dictionary

SIR OTONDE MICHAEL AWITI

Catalog (1876, with several revisions), which became the basis for the dictionary catalog, which was to become the predominant form of catalogs in general libraries in the United States,

- **The Prussian Instructions-PIN Code (1899):** The rules for the alphabetical catalogues of the Prussian libraries gave a significant contribution to cataloguing rules. PIN may be taken to be the second important code of a non-local nature. It was designed originally for compiling a union catalogue of the then German State Libraries. The kingdom of Prussia was then within the German Empire between 1871-1918. It was the leading state of the German empire until its dissolution in 1918. Today Prussia does not even exist on the map, not even as a province of Germany.
- **Dziatzka Code (1886)** Prof. K. Dziatzka, a German librarian published his code. Special features of the code are: - one is that **it does not accept the principle of corporate authorship, entry being made under title, and secondly, the grammatical arrangement of title entries is preferred.**
- **Anglo-American Code (1908):** The American Library Association - ALA (1876) and The British Library Association - LA (1877) issued independent set of rules respectively. Both decided to issue a combined code to secure greater uniformity in cataloguing between English speaking areas in 1908.
- **Vatican Code (1931):** In 1927, the Vatican Library was offered aid by the Carnegie Endowment for International Peace to compile a new catalogue for its collection and a team of American Librarians consisting J.C.M Hanson and W.W. Bishop compiled a catalogue of Printed Books Published in Italian in 1931.
- **ALA Rules (1949):** The ALA cataloguing rules contained 174 Rules for author and title entries. They were the Rules for Descriptive Cataloguing in the Library of Congress. Both the British Library Associations and the American Library Association (LA & ALA) cooperated in preparation for a new joint code but due to outbreak of war, the British participation was discontinued.

SIR OTONDE MICHAEL AWITI

- **The Classified Catalogue Code (1964):** This is the unique contribution of Dr. S.R. Ranganathan from India which can be claimed as universal code. It is the first code complete in every respect for a classified catalogue. The subject approach has been recognized as the dominant one in the **Canadian Committee on Cataloguing (CCC)**. CCC is a national advisory committee on matters of cataloguing and bibliographic control. It also represents Canada on the North American RDA Committee (NARDAC).
- **AACR-1 (1967):** The Anglo-American Cataloguing Rules is the essential international cataloguing code used for descriptive cataloging of various types of information resources by libraries in the United States, Great Britain, Canada, and Australia as well as in many other countries e.g. Kenya. **It was first developed in 1967 and updated regularly until 2005.** It was prepared by the American Library Association (ALA), The Library of Congress, The British Library Association (LA) & The Canadian Library Association. It was edited by Seymour Lubetzky from 1956-62, but later on due to difference of opinion on rules for institution, he resigned and Mr. C Sumner Spalding completed the work in 1962-65.
- **AACR-2 (1978)** It was prepared by the American Library Association (ALA), The British Library, the Canadian Committee on Cataloguing, The British Library Association (LA) and the Library of Congress and is edited by Michael Gorman and Paul W. Winkler. It led to the introduction of a number of new Medias; all these have necessitated a revised code of AACR. **The revisions and updates of the standard are referred to as AACR2.** The second edition of Anglo-American Cataloguing Rules (AACR2) is the most widely used cataloguing code, designed for use in the construction of catalogues and other lists in general libraries of all sizes. AACR2 comprise a detailed set of rules and guidelines for producing metadata (a set of data that describes and gives information about other data) which represents a library information resource or material. **The rules cover the standard description of areas like, the title, publisher, edition, series, etc., as well as the provision of choice and form of access points (headings) for all materials which a library may hold or to which it may have access, including books, serials, cartographic materials, electronic resources, etc.** AACR2 also provides rules for the formulation of standard forms of names and titles to provide access to and grouping of those descriptions. AACR2 standardized cataloging and ensured consistency within the

catalogue and between the catalogues of libraries using the same code in describing the physical attributes of library materials identically.

NB:

Anglo-American Cataloguing Rules (AACR) marked a shift from the previous cataloguing rules, which were criticized for being too detailed, complex, and mere compilations of rules to handle specific bibliographic cases. Anglo-American Cataloguing Rules are considered as the most important advances in English-language codes for descriptive cataloging during the twentieth century.

- **RDA (2003)** Resource Description & Access (RDA) which is developed by the Joint Steering Committee (JSC) for Development of RDA with representatives from the American Library Association, Australian Committee on Cataloguing, British Library, Canadian Committee on Cataloguing, Chartered Institute of Library and Information Professionals (CILIP) and Library of Congress. **RDA is the new cataloguing standard that has replaced AACR-2.**

- **RDA Evolvement**

i. In the early 2000s, discussion began on a new edition of AACR. In 2004, work on the new edition (AACR3) started and Tom Delsey was appointed as the editor. **The Joint Steering Committee (JSC)** decided to revise AACR2 extensively and in December 2004, the draft part I of AACR3 was put out for review. In April 2005, as a result of the reaction to the draft of part I, the JSC decided to scrap AACR3 completely and start afresh in a totally new direction by changing the name of AACR3 to **RDA: Resource Description and Access.**

ii. RDA was decided to be based on the conceptual models, thus; Functional Requirements for Bibliographic Records (FRBR) and Functional Requirements for Authority Data (FRAD) developed by IFLA which provides a flexible framework to describe all bibliographic resources. **FRBR and FRAD provide special attention to digital resources and allows for better efficiency for organizations that use emerging database technologies.**

iii. In June 2009, the JSC delivered the full text of the new standard to the publishers of RDA. **Finally, AACR2 has been succeeded by Resource Description & Access**

(RDA), which was released in June 2010 as part of an integrated online product called RDA Toolkit.

iv. RDA builds on the strengths of AACR2 with some new features that make it more useful for resource description as a cataloguing code for the modern libraries operating in a digital environment. RDA is a package of data elements, guidelines, and instructions for creating library and cultural heritage resource metadata that are well-formed according to international models for user-focused linked data applications.

v. Records created using RDA as the standard must be able to integrate in the same databases with AACR2 records, without causing major disconnects and split files. Thus, the guidelines relating to the form and choice of access points are unlikely to deviate much from AACR2. RDA encourages the addition of data to access points rather than changing the way access points are made.

vi. RDA is available as an online, web-based product called the **RDA Toolkit**. Although the preferred way for most users to access RDA is online via the RDA Toolkit, **print copies of the RDA instructions are also available for purchase.**

2.1 Job of a Cataloguer

- Perform original descriptive and subject cataloging for various library materials.
- Conducting researching to establish appropriate form of main entries, added entries.
- Perform copy cataloging in several subjects and areas derived MARC record.
- Create item record, assign cutter and print spine label for each physical item.
- Carry the primary responsibility for the development of those parts of the catalogs.
- Determine appropriate treatments for series or multipart items in a collection.
- Aid other catalogers in resolving difficult cataloging problems.
- To provide recommendations for the improvement and streamlining of library services.

2.1.1 Competencies of a Cataloguer

- Should understand rules/codes of cataloguing.
- Should have good skills in grammar and use of symbols in English.
- Should have skills in use of sears list of subject headings as well as other subject headings e.g. Library of Congress Subject Headings among others
- Should have ability to understand the change process and strategies/behaviours of users.
- Ability to maintain a conducive environment for job productivity and satisfaction.
- Ability to establish efficient, realistic plans that clearly convey the mission of catalogue.

SIR OTONDE MICHAEL AWITI

- Ability to experiment and take risks and responsibility for outcomes of his organizing.
- Demonstrates a high level of understanding of librarianship.

2.1.2 Cataloguing Process

Cataloguing is the process of preparing entries for a catalogue. The steps involved for making entries are enumerated here below;

- Choice of access point / determination of heading and rendering for the above entries.
- Recording of information under various sections / areas of description of the entries.
- Determination of the style of writing and punctuation marks etc, as per International Standard Bibliographic Description (ISBD).
- Writing call number in all the entries.
- Filing of catalogue cards.
- Preparation of guide/ reference card, proper maintenance and updating of entries in the catalogue.

2.1.3 Guidelines to the Cataloguers

- He must be thorough and well versed with the rules of the catalogue code used for preparing entries.
- The information provided in the entry should be accurate and, most importantly, the choice of access point, otherwise the needed document may not be located.
- The title page is the main source of information to a cataloguer. However, sometimes the information contained in the preface, table of contents and the body of the text etc. is also useful particularly when cataloguing Non Book Materials (NBMs), such as CD's, CD-ROMs, DVDs, micro films, video-cassettes and other web resources.
- The information contained in the catalogue entries should be sufficient enough to provide access points to satisfy the multifarious approaches of the users.
- All the entries for a book should be filed immediately before they are sent to circulation section.
- The entries of all the lost, damaged and withdrawn books should be removed from the catalogue to ensure that the catalogue is kept live and up to date.
- Proper maintenance, use of guide cards and training to the users on how to use the Catalogue is important for optimum utilization of resources of the library.

LESSON 3: Physical Forms of a Catalogue

2.2 Physical Forms of a Catalogue

The Physical Forms of a Catalogue include the following;

- Book Form Catalogue
- Sheaf Form
- Card Form
- Accessories Registers
- MARC (Machine Readable Catalogue) etc.

2.2.1 Advantages and disadvantages of each of the above Forms

Book Form Catalogue

This is a catalogue in which catalogue entries are hand-written or printed and bound into a volume or a book. Many big libraries like British Museum, Calcutta National Library have such catalogues. It is also known as Printed Book catalogue. This kind of catalogue has been a traditional form adopted in many large libraries. Some big libraries used to publish a general printed catalogue of their collection up to date and then issue periodical supplements to keep the original volume up to date.

The book catalogue is a catalogue of books bound in a volume where entries are printed or written on pages. This form of catalogue was developed from the very early days of printing itself. It is also known as Printed Page Catalogue.

Advantages Book Form Catalogue

- **Familiar.** Since this type is a traditional type, people are familiar with this and hence it creates less psychological barrier to the readers.
- **Easy to handle.** Since this type is almost like a conventional type of a book, it is very easy to handle. The catalogue can be referred to with greater speed since opening pages is simple.
- **Economy.** Due to economic problems small libraries are preparing this type for use.

SIR OTONDE MICHAEL AWITI

- **Portability.** Number of copies can be printed and distributed. It is portable. Every Reader can have a copy for his or her reference outside the library
- **Span of vision.** Since this type has many entries on a page, one can go through many entries at a time. The user can see several entries at the same time.
- **Reparable.** Missing pages if there is any missing of pages, it can easily be detected and Rectified because every page is numbered serially. This is not possible in card catalogue because the cards are not numbered.
- **Book selection tool.** This catalogue is used as a book selection tool. It can be used as a reference and book selection tool by other libraries.
- **Saves space.** The catalogue occupies less space.
- **Sharable.** Several readers can refer to the catalogue at the same time by sharing viewing.
- **Publicity tool.** Publicity Since this type of catalogue is portable; it gives more publicity to the library.

Disadvantages Book Form Catalogue

- **Expensive.** The catalogue is too laborious and expensive to produce and compile. Too much of editorial work is involved and as a result, many staff members have to be appointed. This is true if the library is big.
- **Up-to-datedness.** The greatest drawback is up-to-datedness. Latest additions will not find a place in the book catalogue. There is no facility for inserting new entries.
- **Tedious.** Time to find a particular entry one has to go through many entries and sometimes a number of books, thereby consuming a lot of time.
- **Durability.** It is less durable since the book can get torn or lost.
- **Cooperative cataloguing.** This is not possible as cataloguing services are available on books.
- **Guiding.** There is no facility of guiding the users in this form of catalogue.
- **Loss.** The catalogue can be easily lost since a book can be carried out of library by the users or any malicious person
- **Sharability.** The catalogue can only be satisfactorily used by one person at a time.
- **Weeding out.** For missing books, the entries are to be weeded out. This is not possible in book catalogue.

SIR OTONDE MICHAEL AWITI

i. **Sheaf Form catalogue**

This is a form of a catalogue made by sheets, slips or cards fastened in a binder that permits the inserting new material. Its first use was made by the Leyden library Holland.

Advantages of a Sheaf Form Catalogue

- The catalogue has a facility of insertion and removal of entries.
- With this form more than one entry can be prepared on a slip.
- Preparing entries is easier and cheaper to produce.
- The catalogue occupies less space in the library.
- The catalogue is easier to handle and can be removed from the stand.
- This form of catalogue is suitable for large libraries.
- The catalogue is reliable since it is always in the library.

Disadvantages of a Sheaf Form Catalogue

- It is wastage of stationery since one book is entered on one slip.
- If three books are entered the catalogue becomes overcrowded and needs retyping.
- Carbon copies of the catalogue are not so pleasant as that of original.
- The catalogue uses slips of paper which are less durable.
- The process of insertion and withdrawal is not so easy.
- Cooperative cataloguing is not possible in this form of catalogue.
- Guiding provide by this form is not satisfactory to the users.
- Catalogue can only be consulted/ used within the library.

SIR OTONDE MICHAEL AWITI

ii. Card Form catalogue

This is a form of catalogue where the entries are made and arranged on cards of uniform size of 12.5 cm x 7.5 cm and kept in drawers of catalogue cabinet.

The **card catalogue** was a familiar sight to library users for generations, but it has been effectively replaced by the (OPAC). Some still refer to the online catalogue as a card catalogue. Some libraries with OPAC access still have card catalogs on site, but these are now strictly a secondary resource and are seldom updated. Many libraries that retain their physical

SIR OTONDE MICHAEL AWITI

card catalog will post a sign advising the last year that the card catalog was updated. Some libraries have eliminated their card catalog in favor of the OPAC for the purpose of saving space for other use, such as additional shelving.

Advantages Card Form Catalogue

- The catalogue allows inserting and withdrawal of cards this keeps it up to date.
- The users can be easily guided on the use of the cards.
- Entries prepared on cards is easier to consult and handle by the users.
- Card catalogue is more durable from other physical forms.
- The cards can be arranged in any desired order by the cataloguer.
- Cooperative cataloguing is possible in this form of a catalogue.
- This form is more economic to maintain and cards can be changed at any time.
- The cards also can present a neat appearance since they are of the same size.

Disadvantages Card Form Catalogue

- This form of catalogue occupies much space of the library.
- With this form of only one user can consult catalogue at a time.
- This catalogue is not portable.
- It can only be consulted within the library where it is.
- With this form marking cards and cabinets are too expensive
- The readers can also easily take out the cards and take them.
- Most users do not know how to consult it.

Iv. Accessories Registers

This is form of catalogue where the entries of documents are written in hand in a bound registers or ledger. For example, accessions register user borrowing registers of the library.

Advantages Accessories Registers

- The readers can use this catalogue with unquestionable ease.
- The reader can consult the circulation counter or reference desk.
- More than two readers can use it because it is portability.
- The reader can also see several entries on same page which saves precious time.
- It does not copy much space of the library
- It doesn't require special equipment to display due to its compactness.
- It much more convenient to consult it because it like a book or register.

Disadvantages Accessories Registers

- This form does not allow inserting of new books entries.
- This form cannot be kept up to date since at times or period the register is closed.
- The quality of paper used is not thick as the card catalogue making it less durable.

SIR OTONDE MICHAEL AWITI

- It can easily be of stolen, damaged, turnout, mutilated by the users.
- Most users do not ask for it because of its name most of them prefer other catalogues.
- It is expensive to make and requires trained personnel to manage it and update.
- The arrangement is not uniform since there are no rules to follow when making the registers.

v. MARC (Machine Readable Catalogue)

These Catalogues are prepared on a magnetic tape or magnetic disc and accessed by use of network or internet. Examples include:

- Visible Index

This catalogue consists of strips mounted on a frame or cards held flat, hinged and with edge of each card protecting so as to make the heading visible.

- Microform Catalogue

This is a form of catalogue where the entries are reduced and printed upon a film or fiche.

This not common because microfilm machines are expensive.

- Online Public Access Catalogue (OPAC)

This is online public access catalogue which can be compatible with the web 2.0 technologies or accessed on the internet.

Advantages of MARC (Machine Readable Catalogue)

- These forms of catalogues are usually kept update.
- The catalogues can be used by users with a high level of efficiency.
- They can be searched with high speed due to use of internet and computers.
- The catalogues are compact that is they can have very many entries.
- They occupy less space since they are stored on networks and computers.

SIR OTONDE MICHAEL AWITI

- They are portability and can be accessed anywhere as long as there is connection.
- Multiple copies can be generated at the lower cost and cheap to make.
- Corporative cataloguing is possible with this catalogue form.

Disadvantages of MARC (Machine Readable Catalogue)

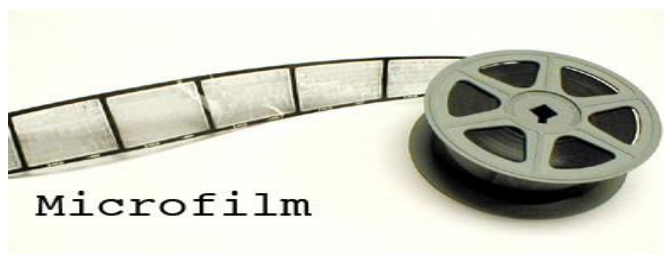

- They are very expensive to make and develop.
- They require users to have computer skill to use the catalogue.
- The catalogue can be affected by power shortages.
- Maintain this form if catalogue requires experts in computer making it not easy.
- This form of catalogue can kill library spirit of the users since they can access outside.
- All data can be lost in case of virus attack or hackers on the catalogue.
- Users may not use this kind of catalogue if they are not familiar with computers.
- They also follow new code of cataloguing that is RDA yet most people prefer AACR2.

Vi. Microform Catalogues

Microform is a general term for any material that contains a small image or micro reproduction of a document. These document images are usually found on film. There are two common film formats: **microfilm and microfiche**;

- **Microfilm** is a roll of film.
- **Microfiche** is a flat sheet of film.

The images are so small and therefore **special readers/scanners are used to view the documents**. Microforms help to save space. Thousands of newspapers, journals or government documents can be stored in a few cabinets.

SIR OTONDE MICHAEL AWITI

Advantages of Microform Catalogues

- Saves library space , up to 95% because the catalogues are part of the collection
- Cost savings in terms of reproduction & distribution.
- The print medium is archival stable and has an estimated shelf life of over 500 years.
- Information can be recovered from the medium with a magnifying glass.

Disadvantages of Microform Catalogues

- Patrons must use magnification to use the medium
- Reader/scanners can be difficult to operate
- Reader/scanners can break down or not be available
- Items can be easily misfiled in high density cases
- Not as convenient and lacks features available in digital formats
- Expensive Readers and scanners are needed to retrieve information

vii. Guard Book Catalogue

It is a variation of book catalogue. In this form entries are printed or typed on a slip and kept in arranged manner in guard book after pasting each slip on a thicker sheet. More than one entry is normally pasted on one sheet and sufficient vacant spaces are left to accommodate new entries. If vacant spaces are less than the entries to be pasted, one or two sheets are taken out and cancelled and new sheets are added after pasting new entries as well as old entries appearing on cancelled sheet in appropriate order.

SIR OTONDE MICHAEL AWITI

Advantages and Disadvantages of Guard Book Catalogue

The Guard Book Catalogue's merits and demerits are more or less similar to book catalogue. But it decidedly has better qualities of being updated and is more flexible than book catalogue. The work and process of updating it is time consuming and complicated. It occupies more sheets in appropriate order.

Guard Book Catalogue

SIR OTONDE MICHAEL AWITI

LESSON: 4 Types of Library Catalogue (Inner Forms of a Library Catalogue)

3.0 Types of Library Catalogue (Inner Forms of a Library Catalogue)

In catalogue, both the physical form and inner form is equally important. The inner forms of the catalogue include the necessary entries that are essential to describe a document. The inner form decides which one of the several access points is to be considered '**Prime**' or '**important**' or '**main**'. In a classified catalogue, **the class** to which the book belongs is considered as important.

3.1 Author Catalogue

- This is a catalogue in which entries are arranged alphabetically
- It shows the works of a given author held by the library
- It reveals whether the library is having a particular work of the author (**In the author catalogue, the editor, compiler, translator, reviser, translator e.t.c. will appear as an added entry so as to reflect his or her responsibility**).

3.2 Name Catalogue

This is a catalogue which is;

- Arranged in one alphabetical sequence **restricted to author and subject**.
- A **variation or extended form of author catalogue**. The difference between author catalogue and name catalogue is that author catalogue includes entries for the names of persons etc. as authors, i.e. it brings at one place entries for all books written by one author.

3.3 Subject Catalogue

- It is the catalogue in which the headings on the entries are made under the name of the specific subject of the book and are arranged alphabetically.
- It satisfies readers approach for the subject point of view only.

3.4 Title Catalogue

- It is a catalogue which consists of entries for books under their titles arranged alphabetically.

SIR OTONDE MICHAEL AWITI

- Title catalogue in its pure form is rare now-a-days since most users view books according to subjects not titles. This is because so many books and other information resources are being published by the day and therefore the library users find it hard to memorize the titles.

3.5 Dictionary Catalogue

This is a catalogue usually on cards in which **all the entries and their related references are arranged together in one general alphabet**. It is a compilation of all the main entries, added entries, subject entries and reference cards.

- The arrangement is **strictly alphabetical** irrespective of the name of author, title and subject e.t.c

These headings are arranged in one alphabetical sequence as follows:

Anatomy	Subject
Arivumathi	Author
Asian Tour	Title
Biochemistry	Subject
Bushnell T	Joint author
Chatterjee M.	Editor
Ganguli S.	Illustrator
Geography	Sub.
Jackson K.	Comp.
Law	Sub.
Medicine	Sub.
Narayanan R.	Author.
Psychology	Sub.
Travel in India	Series.

From the above arrangement, the headings are quite unrelated to each other as they stand their positions in the catalogue. Their position is determined by the alphabets used in their spellings. This type of catalogue is called a **dictionary catalogue** because of its resemblance to a dictionary in arrangement, that is, it follows the simple alphabetical order of any dictionary. It is easy to consult. But it has many problems.

Advantages of a Dictionary Catalogue

- It is very easy to consult.
- Knowledge of classification scheme is not required to use it.
- The subject headings can be assigned in accordance with reader's terminology.
- It provides all possible ways of readers approach
- It is useful for specific information and ready reference.

Disadvantages of a Dictionary Catalogue

- Entries pertaining to related subjects are placed away from each other because of alphabetical arrangement. For example, entry for **electricity** and **magnet** will be filed or arranged far away from each other although the terms are related.
- The reference and cross references confuse the readers.
- It becomes complex and inconvenient as the catalogue grows i.e. it becomes over crowded.
- Dependence on subject headings may create problems because the meaning of a word may change with the change of place e.g. **Corn** in America is referred to as **Maize** in many other parts of the world.

3.6 Classified Catalogue

- A classified catalogue is a Catalogue in which some entries are **number entries** and some are **word entries**.
- The arrangement of the catalogue entries follow the classification scheme adopted in a library. In the main entry card there must be the call number of a book. **The call number indicates the subject treated in a book.**
- In the arrangement of catalogue entries in a classified catalogue, the name of the author or the heading is ignored and **the main entries are arranged according to the call numbers of the books as noted in the main entries**. Thus, the main entries are arranged according to subject fields of the books. **So, basically, classified catalogue is a subject catalogue.**
- Classified catalogue is primarily **a subject catalogue arranged on the basis of notation (class number)**. Thus classified catalogue has two parts, classified part and alphabetical part. Classified part is the main part and the **alphabetical part is index or secondary part**.
- The classified catalogue should be **composed of three separate parts or files**, although strictly speaking, the subject file or the classified file is in itself the classified catalogue proper. The three parts are as follows;

(a) Subject of classified file or classified catalogue proper: It is usually arranged according to classification scheme followed in the library. The arrangement of entries is determined by the call number of the books or the notation marked in the catalogue entry, both for main entries and added entries.

(b) Author-title files or alphabetical author index. The index entries are prepared under the names of the authors or the titles as the case may be and arranged in the alphabetical order. Every entry should bear the call number of the book to locate the main entry.

(c) **Subject file or alphabetical subject index.** The index entries are made under specific subject headings in natural verbal language and arranged in alphabetical order.

Advantages of a Classified Catalogue

- The main entries are arranged systematically and logically.
- The respective fields of subjects can be seen in the catalogue, because the subjects are arranged one after another and the allied and related subjects are placed in close proximity.
- The forms of literature are arranged in one place.
- It has both arrangements, classified in the main file or the classified file, and alphabetical in the author index and subject index.
- It is very helpful to subject approach.

Disadvantages a Classified Catalogue

- (Readers may have psychological aversion to this kind of catalogue considering its complicated character.
- It will take more time to find a particular entry in a large library.
- It does not supplement the order of arrangement of books on the shelves.
- Subjects not enumerated in the classification scheme may not be available easily in the catalogue.

3.7Alphabetic Classed Catalogue

- Cutter has defined it as one which the subjects are grouped in broad classes with numerous alphabetic sub-divisions. It may also include author and title entries in the same alphabet.
- It is a **subject catalogue** in which main divisions are ordinarily arranged in some logically progressive order and subdivisions alphabetically.

3.8 Filing

There are different types of entries in a library catalogue. These may include the author, title subject inter alia. These entries need to be arranged in a proper order which will enable a reader to access the required documents available in the library. In a library catalogue, once

the entries are ready, they are filed in a proper sequence. Filing is concerned with arranging of entries in an order.

3.8.1 Filing Codes or Rules

There are different codes or rules for filing catalogue entries. There are also some cataloguing codes which prescribes such rules. Cutter's Rules for a Dictionary Catalogue, Vatican Catalogue, Classified Catalogue Code, etc. have included filing rules in their codes or rules. Some major filing systems or codes which have evolved as separate codes or rules include among others:

(a) Library of Congress Filing Rules

b) ALA (American Library Association) filing rules

3.8.2 ALA (American Library Association) Filing Rules

ALA Filing Rules were developed in the late 1970s and present rules for the arrangement of bibliographic records whether displayed in card, book, or online format.

Filing involves alphabetisation to a great extent. For alphabetisation there are two rules namely, letter-by-letter alphabetization and word-by-word alphabetisation.

- Letter-by-letter filing is also known as “All through alphabetisation” or “solid filing”. In this rule, letters are taken in their sequence irrespective of their word division. This method ignores variation in type-script, mark, space, between words and sentences, etc.
- Word-by-word filing is also known as “Nothing before something” method. In this rule each word is taken as a unit.

3.8.3 The rationale for ALA Filing Rules;

Even though library catalogs are now online, with built-in programming to create screen displays of search results in alphabetic (or other) order, and the software we use will arrange lists for us at the click of a mouse, there are still times we need filing rules to provide consistency in the arrangement of text, books, or files. For libraries which for instance arrange fiction by the author's last name, it may be necessary to refer to a set of filing rules to determine the proper sequencing of works, for example, books by Debbie **Macomber** and Megan **McDonald**, in a specific library.

3.8.4 Basic Instructions

The two main versions of filing rules: **letter-by-letter** and **word-by-word** as compared below:

A. <u>WORD BY WORD</u>	<u>LETTER-BY-LETTER</u>
New Amsterdam	New Amsterdam
New England	Newark
New wives for old	New England
Newark	Newman
Newman	New wives for old
B. Machines speak	Machines speak
Material sciences	Materials
Materials	Material sciences
Men of physics	Mend yourself
Mend yourself	Men of physics

• **Letter by Letter Filing Rules:**
These rules are "letter-by-letter" (or "character by character") rules. They also largely ignore distinctions among different punctuation marks and do not distinguish among the types of access points.

In these rules, for example, names beginning with M', Mc, and Mac are filed alphabetically as spelt or spelled.

MacDonald, David
MacDonegan, Steven
Macomber, Debbie
McDonald, Ronald
McDonegan, Cecelia

These rules do not make distinctions between types of headings

Spelling bees in history

SIR OTONDE MICHAEL AWITI

Ste. Genevieve Palace
Stinson lectures
St. Louis Arch

Word-by-word:

The ALA Rules for Filing Catalog Cards, 2nd ed., by Pauline A. Seeley, is the classic guide to filing catalog cards using the basic order of alphabetical, "word-by-word" rules. They retain provisions for observing hierarchy in the form of catalog entries.

In these rules, names beginning with M', Mc, and Mac were all filed as if spelled or spelt "Mac".

MacDonald, David
McDonald, Ronald
McDonegan, Cecelia
MacDonegan, Steven
Macomber, Debbie

These rules do not make distinctions between types of headings and file "nothing before something"

• Additional Important Highlights

- a) **Ligatures or symbols** such as the "Ampersand (&)" should be spelt out: In English: and; in French et;
- b) **Filing of numerals:** to be filed as spoken e.g. 1914 [Nineteen fourteen], \$20 [Twenty dollars]
- c) **Chronological filing:** Chronological filing: Time preempts alphabetization.
U.S.–History–Revolution, 1775-1783
U.S.–History–1800-

SIR OTONDE MICHAEL AWITI

U.S.–History–1801-1809

U.S.–History–War of 1812

U.S.–History–Civil War, 1861-1865

U.S.–History–1900-1939.

d) Initial articles are disregarded: a, an, the. Also foreign equivalents: un, une, le and la in **French**. Disregard an initial article in all languages and file by the word following it. An exception to this rule is certain foreign proper names beginning with an article e.g. “The USA”.

e) Modified letters or diacritics: á, â, ä, à, å, æ, etc., are usually treated as if not modified.

f) Elisions: the omission of a sound or syllable when speaking (as in *I’m, let’s*). File as written: e.g. **who’s who** NOT **who is who**.

3.8.5 The Importance of Accurate Filing in a Library Catalogue

In the cataloguing section of a library, it is necessary to take into consideration that the catalogue entries are filed in a proper manner.

Filing :

- Enables one to arrange the entries of a catalogue according to some definite plan.
- Save time in the use of catalogue
- Brings together all the related entries
- Makes the library users aware of unexpected items
- Facilitates manipulation and handling of the catalogue easily

3.9 MARC 21 Format Detailed Explanation

MARC is the acronym for **Machine-Readable Cataloging**. It defines a data format that emerged from a Library of Congress-led initiative that began nearly forty years ago.

SIR OTONDE MICHAEL AWITI

There are several versions of MARC in use around the world, the most predominant being **MARC 21 created in 1999** as a result of the harmonization of U.S. and Canadian MARC formats, and UNIMARC. UNIMARC is maintained by the Permanent UNIMARC Committee of the International Federation of Library Associations (IFLA), and is widely used in Europe. The MARC 21 family of standards now includes formats for authority records, holdings records, classification schedules, and community information, in addition to the format for bibliographic records.

A MARC 21 format is a **set of codes and content designators defined for encoding machine-readable records**. MARC 21 Format for Bibliographic Data contains format specifications for encoding data elements needed to describe, retrieve, and control various forms of bibliographic material.

The five MARC 21 communication formats are widely used standards for the representation and exchange of bibliographic, authority, holdings, classification, and community information data in machine-readable form. MARC 21 is the standard used by most library computer programs.

3.9.1 MARC 21 communication formats

The MARC 21 communication formats include the following;

- MARC 21 format for Bibliographic Data
- MARC 21 format for Authority Data
- MARC 21 format for Holdings Data
- MARC 21 format for Classification Data
- MARC 21 format for Community Information

3.9.2 Scope of the Bibliographic Format;

MARC 21 Format for Bibliographic Data is designed to be a carrier for bibliographic information about **printed and manuscript textual materials, computer files, maps, music, continuing resources, visual materials, and mixed materials**. Bibliographic data commonly includes titles, names, subjects, notes, publication data, and information about the

physical description of an item. **The bibliographic format contains data elements for the following types of material:**

- **Books (BK)** - used for printed, electronic, manuscript and microform textual material that is monographic in nature.
- **Continuing resources (CR)** - used for printed, electronic, manuscript, and microform textual material that is issued in parts with a recurring pattern of publication (e.g., periodicals, newspapers, yearbooks). (**NOTE:** Prior to 2002, continuing resources (CR) were referred to as Serials (SE)).
- **Computer files (CF)** - used for computer software, numeric data, computer-oriented multimedia, online systems or services. Other classes of electronic resources are coded for their most significant aspect. Material may be monographic or serial in nature.
- **Maps (MP)** - used for all types of printed, electronic, manuscript, and microform cartographic materials, including atlases, sheet maps, and globes. Material may be monographic or serial in nature.
- **Music (MU)** - used for printed, electronic, manuscript, and microform music, as well as musical sound recordings, and non-musical sound recordings. Material may be monographic or serial in nature.
- **Visual materials (VM)** - used for projected media, non-projected media, two-dimensional graphics, three-dimensional artifacts or naturally occurring objects, and kits. Material may be monographic or serial in nature.
- **Mixed materials (MX)** - used primarily for archival and manuscript collections of a mixture of forms of material. Material may be monographic or serial in nature. (**NOTE:** Prior to 1994, Mixed materials (MX) were referred to as Archival and manuscript material (AM)).

3.10 Tagging and formatting of subject and classification information for computer Input

- MARC tagging is **variety of codes**, usually called tags, indicators, and delimiters, to signal to a computer that a certain type of information is following the code so that it can format it correctly and allow proper searching.

- A tag in a MARC record is **the three-digit number assigned to each field in the MARC record**. There are many tags that can be used, and often the tag indicates specific information about the field. For example, a topical subject heading has a different tag than a geographic subject heading.

3.10.1 Metadata Definition

Metadata, at its most basic level, is ‘data about data.’ Metadata should be structured, organized information about an object such as its source, scope, physical or digital characteristics, context, or any other details about the object itself. It applies to both physical (analog) and digital objects.

- Metadata in books: Title, author, ISBN, call number. See the Figure below showing the **MARC metadata**;

SIR OTONDE MICHAEL AWITI

While data within library catalogues is indeed a type of metadata, the library community typically refers to the set of processes related to describing books and serials within MARC using AACR2 as 'cataloging.' Metadata, on the other hand, is conventionally used to differentiate between this work and the processes associated with describing digital objects.

LESSON 5: Kinds of Entries

4.0 Entries: Introduction

S.R.Ranganathan defined an entry as **ultimate unit record in a catalogue or a documentation list**. We provide multiple entries for a document in a library catalogue with the user's various approaches to find a document in mind. **The user may try to find out a book of a known author; or, of a known title or, seeking books on a subject of interest.** These are some of the reasons why we provide several entries in a library Catalogue. Of the several entries we provide, the basic entry (**known as the Main Entry**) provides maximum data or information about a document. All other entries are known as **added entries**. In a card catalogue, added entries also carry all the details of a book as in a Main Entry but with the added entry typed at the top of the card in a conspicuous colour (usually, red) for interfiling purposes.

To make the catalogue more meaningful and effective as a search tool that can save the time of the user, several other types of entries like **"See" and "See also" References** are included. The "see" and "see also" references in a library's catalogue are supposed to **provide the cross-references necessary to guide the user to the appropriate subject heading**. For example, a **"see"** reference refers you from an unused term to a used term i.e. ornithology (**scientific name for birds**), **see birds**. This means that anything about birds in the catalogue is listed under birds. The **See also** reference refers you to other used term related to this one. These terms may be "siblings" or "children" of the parent term. For example, you may see "birds **see also** reptiles". Both terms are at an equal level and so they are like "siblings or brothers and sisters. However, **'birds, see also eagles, flamingos, parakeets'** refer to terms that are narrower than the parent term birds. These narrower terms are like "children or sons and daughters" of the parent term **birds**.

The local examples:

(i) **Sukuma wiki see kale**. This means that a user who searches for the term **Sukuma wiki** in the catalogue will be directed to check under the term **kale** because it is the term that is in standard use within the library catalogue.

SIR OTONDE MICHAEL AWITI

(ii) **Maize** see also **Corn** means that the two terms are used in the catalogue and so the user will not miss information resources or materials on **maize or corn** which are synonyms that are used in different countries.

Entries are needed as records of information:

- They help us to describe an item.
- Entries are also helpful sometimes to find out the items that are inter-related.
- Library catalogue entries are not only useful as search tools for users but they also serve as inventories for the stock of documents acquired and added to the lib

4.1 Main Entry

- Main entry is the basic entry and it gives the maximum information about the bibliographical details of the document being catalogued.
- Main entry is defined as a specific entry giving maximum information about the whole of a document.
- Main entry is the first entry which is made when cataloguing information materials.

Examples of Card Catalogue Entries

4.1.2 Functions of main entry

SIR OTONDE MICHAEL AWITI

- The main entry helps in locating the books.
- It gives maximum information about the bibliographical details of the book.
- It works as a key to all the added entries.
- Tracing area helps to assistant cataloguer to prepare added entries.
- It helps in tracing for added entries for the same information materials.
- There is only one main entry for each document thus it can be used for inventory.
- Reveal the number of documents in a particular subject acquired by the library.

4.2 Added Entries

Added entries are secondary entries or other entries made after the main entry.

4.2.1 Types of Added Entries

The following types of added entries according to ACCR 2 code are prepared:

- Title added entry
- Subject added entry
- Series added entry
- Author reference added entry
- Second author added entry
- Editors added entry

4.2.2 Functions of Added Entries

An added entry;

- Allows the reader to access the document if he or she knows the subject.
- Gives options to readers when they are searching for information.
- Helps to identify and determine the subjects of the book.
- Helps in avoiding duplication of subject entries.
- Provides the name of a co – author/s, collaborator, title and series approach by the readers.
- Allows the reader to know the total number of books on a particular subject, by a certain author and in a certain series
- Allows preparation of one cross reference index entry (In an index, a cross-reference is often denoted by “See also”) so as to limit the number of index entries. Cross reference index entries direct the users from one heading to another

4.2.3 Subject added entries

Subject added entries are made for all subjects that at associated with the tittle of the book.

4.2.4 Author Added Entries

- Added entries are made for two and three author books
- Editors added entry is made for two and three editors’ books without authors
- Compilers added entries are made for two or three books without authors added entries
- Incase the books has more than three authors or editors or compilers we make no added entry for it

4.2.5 Title Added Entries

- Title Added entry are for main title
- Title Added entry for pararell title
- Title added entry is made for title proper.

4.2.6 Series added Entries

- Series Added entry are for main series title
- Series Added entry for pararell series title
- Series added entry is made for title proper
- 6B. Title proper of series
- 6C. Statements of responsibility relating to series
- 6D. Numbering within series
- 6E. Subseries
- 6F. More than one series

4.2.7 Editors added entries

Names of editors

5.0 Processes followed in Cataloguing according to AACR 2

Three Levels of Description;

- **First level** of description provides the minimum information which is necessary to identify a given document. It is shown in the following schematic illustration: Title proper/first statement of responsibility, if different from main entry heading in from or number or if there is no main entry heading. -Edition statement. -Material (or type of publication) specific details. -First publisher, etc., date of publication, etc. -Extent of item. Notes. -Standard number.
- **The second level** is a standard description which includes all the data which is necessary for description of documents. It is shown in the following schematic illustration: Title proper [general material designation] = Parallel title: other title information/first statement of responsibility; each subsequent statement of responsibility. -Edition statement/first statement of responsibility relating to the edition. -Material (or type of publication) specific details. -First place of publication, etc.: first publisher, etc., date of publication, etc -Extent of item: other physical details; dimensions.- (Tile proper of series/statement of responsibility relating to series, ISSN of series; numbering within the series. Title of subseries, ISSN of subseries; numbering within subseries). Note(s). – Standard number.

SIR OTONDE MICHAEL AWITI

- **The third level** provides information covering every descriptive element described in this code which are applicable to the particular item that is catalogued are to be included. **The choice of level of description would depend upon the objectives of a cataloguing and requirements of a particular library.** In most of the libraries the second level of description is adopted regarding it as a standard description.

LESSON 6: Choice of Access Points.

5.1 Choice of Access Points.

Reference: 21A. Main and added entries

- Decide the access points name headings or titles to be added to bibliographic description
- Decide which access point is the heading for the main entry and added entries.
- If your library does not distinguish between main entries and added entries, treat all access points as equal
- Generally, each rule only covers certain added entry access points.
- Additional added-entry access points may be required.

5.2 Descriptive Cataloguing

Descriptive cataloging is the process of identifying and describing the bibliographic and physical form of an item, determining the name(s) and title(s) that will be used as access points, and recording these data in a bibliographic record.

5.2.1 Set of rules

Descriptive cataloging involves applying a standardized set of rules,thus;

- currently RDA: Resource Description and Access, to record the title, authorship, and publication data for a work, describe the physical extent of the work,
- In 1841, Antonio Panizzi wrote 91 Rules for Compilation of the Catalogue for use at the British Museum (now the British Library).

SIR OTONDE MICHAEL AWITI

- In 1876, Charles Ammi Cutter (1837-1903), published the first edition of Rules for a Printed Dictionary Catalogue.
- By 1908, the American Library Association and the Library Association collaborated on the first international cataloging code as Catalog Rules: Author and Title Entries.
- Over the next century, Anglo-American Cataloging Rules (AACR). AACR was maintained by an international committee and revised in 1988, 1998, and 2002.
- In 2004, work began on a comprehensive revision and recasting of the rules, RDA: Resource Description and Access. RDA was published in the RDA Toolkit in June 2010.

5.3 Subject Analysis using Subject Heading such as sears list of Subject Headings.

- Sears list of Subject Headings is a book that provides a list of subject headings for small libraries to use.
- The List of Subject Headings (LSH) can be defined as the standard source for validation of subject headings assigned to individual cataloguing records.
- A subject heading is the word or phrase used on catalogue cards to express the theme or topic of a book.

5.3.1 Methods of deriving subject headings

In cataloguing to ascertain the true subject of the material being catalogued is very important hence, we should examine the following consideration:

- Read the title page
- Examine the table of contents and skim the preface and introduction.
- If the subject is still not clear, examine the text carefully and read parts of it.
- In the case of non-book materials, the cataloguer should examine the container.
- Check for any accompanying guides and view or listen to the contents if possible.
- Reference sources or experts should be consulted.

5.3.2 Principles for Subject Headings

To achieve good practice in assigning headings, it is important to understand the following principles involved in formulating subject headings.

SIR OTONDE MICHAEL AWITI

- **Literary warrant:** The terminology selected to formulate individual subject heading which is created for use in cataloguing should reflect the terminology used in current literature
- **Uniform heading:** Subject heading is chosen to represent a topic based on standard, contemporary English-language usage or preference given to terms in general use over technical terms possible.
- **Unique heading:** Each heading in the List of Subject Headings (LSH) represents only one topic. If a term could represent more than one concept, it should be modified
- **Specific entry:** Each subject is represented by the most precise term naming the subject, rather than a broader or generic term that encompasses it.
- **Consistency:** LSHs contain numerous inconsistencies in styles of headings in its various editions. Attempts have been made to maintain consistency in form and structure.
- **Dynamism:** Changes to headings are made continuously to maintain the currency and viability of LSH for example, **Handicapped** to **People with disabilities**.
- **Pre-coordination and post-coordination:** LSH is primarily a pre-coordinate system; combining elements into one heading string in anticipation of a search on that compound topic

5.4 Authority Control

- Authority control is a process that organizes bibliographic information, for example in library catalogs by using a single, distinct spelling of a name (heading) or a numeric identifier for each topic.
- Authority Control ensures **the consistency and correctness of names** and subject headings entered into the bibliographic description.
- Authority control functions to standardize catalogue entries so that items in a collection are more easily accessible and so that like and related items can be gathered and/or linked.

5.5 Punctuations used in descriptive Cataloguing etc.

Title and statement of responsibility area

1A1. Punctuation

SIR OTONDE MICHAEL AWITI

- Precede the title of a separate part, supplement, or section by a full stop, space (.)
- Enclose the general material designation in square brackets ([]).
- Precede a parallel title by a space, equals sign, space (=).
- Precede other title information by a space, colon, space (:).
- Precede the first statement of responsibility by a space, diagonal slash, and space (/).
- Precede each other statement of responsibility by a space, semicolon, space (;).

Edition Area

2A1. Punctuation

- Precede this area by a full stop, space, dash, space (. —).
- Replace words with standard abbreviations. New ed. (New Edition) Rev. ed.
- Replace words with numbers where appropriate.
- Precede a statement of responsibility following an edition statement by a space, diagonal slash, space (/).

Publication, Distribution, Etc., Area

4A1. Punctuation

- Precede this area by a full stop, space, dash, space (. —).
- Precede a second place of publication, etc., by a space, semicolon, space (;).
- Precede the name of a publisher, etc., by a space, colon, space (:).
- Precede the date of publication, etc., by a comma, space (,).

Physical Description Area

5A1. Punctuation

- Precede this area by a full stop, space, dash, space (. —) or start a new paragraph.
- 5B2. Record the number of roman pages use small romans and coma for example xv,
- 5B2. Record the number of Arabic pages use small p for example 15 p.
- Precede the other details like dimensions by a space, colon, space (:).
- 5C. Other details pictures or illustrations use abbreviation “ill.”
- 5C. If all the illustrations are coloured, give “col. ill.”. If some of the illustrations are coloured, give “ill. (some col.)”.
- Precede the dimensions by a space, semicolon, space (; 15 cm.).
- Precede the statement of accompanying materials by a space, plus sign, space (+).

SIR OTONDE MICHAEL AWITI

Series Area

6A1. Punctuation

- Precede this area by a full stop, space, dash, space (. —).
- Enclose each series statement in parentheses (()).
- Precede a statement of responsibility relating to a series by a space, slash, space (/).
- Precede the numbering within a series by a space, semicolon, space (;).
- Precede the title of a subseries by a full stop, space (.).

Note Area

7A2. Punctuation

- Precede each note by a full stop, space, dash, space (. —) or each as a paragraph
- Separate any introductory word of a note from the rest by a colon, space (:).

Standard Number

8A1. Punctuation

- Precede this area by a full stop, space, dash, space (. —) or start a new paragraph

6.0 Authorship according to AACR 2

6.1 Single Authorship

A personal author is the person who is chiefly responsible for the content of a work.

Examples are: writers of texts, composers of music, artists, photographers, compilers of bibliographies, cartographers, creators of electronic resources

- Enter a work by one person under the heading for that person.
- Enter a work by two or more persons under the person named first or its title.
- Make added entries as instructed in rules.

6.2 Shared Authorship

Enter a work by two or more persons under:

- The principal personal author
- The person named first
- Its title
- Make added entries as instructed.

6.3 Mixed Authorship

SIR OTONDE MICHAEL AWITI

A work of mixed responsibility is one that involves the collaboration of two or more persons or bodies. Typical instances of mixed responsibility are:

- A work with text by one person and illustrations by another
- A work created by one person and adapted by another
- A work by one person translated by another
- A musical work by one person performed by another person or by a performing group.

This rule divides all cases of mixed responsibility into two types.

Modifications of existing works

- Enter a work that is a modification of an existing work under the heading for the new work and make a name/title added entry for the original work
- Enter any other modification of an existing work under the heading for the original work.

New works produced by persons or bodies making different intellectual or artistic contributions

- Enter a work under the heading for the person or body given prominence by the wording or layout of the chief source of information of the being catalogued.
- If there are two or three collaborating persons or bodies, make an added entry under the heading(s) for the other(s).
- If no one person or body is given prominence enter under the heading for the person or body named first in the chief source.

6.3.1 Use of Corporate bodies as authors

A corporate body is an organization or group of persons that has a name. Enter a work issued by a corporate body or originating from a corporate body under the heading for that body if it is one or more of the following:

- an administrative work dealing with itself or its policies, procedures, operations, etc.
- a law or collection of laws, an administrative regulation, a treaty
- a report of a committee, commission, etc.
- a liturgical text for which a particular church, denomination, etc., is responsible
- a collection of papers given at a conference provided that the conference is named
- a sound recording, video recording, or film created and performed by a group

- a map or other cartographic material created by a corporate body.

6.4 Works for Which One Person or Corporate Body is Responsible

24A. Works by one person

Enter a work by one person under the heading for that person even if he or she is not named in the bibliographic resource being catalogued.

24B. Works for which one corporate body is responsible

If a work originating from a single corporate body falls into one or more of the categories listed in rule 23B2, enter it under the heading for the body.

25B. Principal responsibility indicated

25B1. If the layout or wording of the chief source of information indicates clearly that one person or body is chiefly responsible, enter under the heading for that person or body.

Make added entries under the headings for the other persons or bodies if there are not more than two of them

6.5 Use of Pseudonyms

Pseudonym is a name assumed by an author.

32A. Persons using pseudonyms

32A1. One pseudonym.

- If all the works by a person appear under one pseudonym, choose the pseudonym. Make a reference from the real name if you know it.
- If two or more collaborators use a single pseudonym, choose that pseudonym. Make references from the names of the collaborators if they are known.

32A2. More than one pseudonym.

- If a person uses more than one pseudonym choose the name found in the chief sources of information of manifestations of that work. Make references to connect the names.
- If different names for such a person appear in different editions of the same work choose the name that has most frequently appeared in editions of the work
- If a person using more than one pseudonym or his or her real name choose the name by which that person has come to be identified in later edition of his or her works.

32B. Persons not using pseudonyms

Is known by more than one name or form of a name choose the name or form of name by which the person is clearly most commonly known.

Otherwise, choose (in this order of preference):

- the name that appears most frequently in manifestations of the person's works
- the name that appears most frequently in current reference sources
- the latest name.

6.6 Use of Titles when no Authorship is established etc.

Entry under title

Enter a work under its title when:

- The author is unknown and no corporate body is responsible
- The work has more than three authors
- It is a collection and has a collective title
- It is not by a person or persons and is issued by a corporate body
- It is a sacred scripture (such as the Bible, the Koran, or the Talmud)

LESSON 7: ISBDs

7.0 International Standard Bibliographic description (ISBDs) and related elements

The International Standard Bibliographic Description (ISBD) is a set of rules produced by the International Federation of Library Associations and Institutions (IFLA) to create a bibliographic description in a standard, Human-readable form, especially for use in a bibliography or a library catalogue.

Forms/ Types of ISBDs;

7.1 ISBD (G)-General

This is meant to serve the ISBD of all the materials which have been published. It has eight areas having information about country, continent, publisher, author, material types.

7.2 ISBD (A) - Antiquarians

SIR OTONDE MICHAEL AWITI

- ISBD (A) is the International Standard Bibliographic Description for Older Monographic Publications referred to as (Antiquarian). It was approved by **the Standing Committees of the IFLA Section on Cataloguing and the IFLA Section on Rare Books and Manuscripts.**
- ISBD (A) is designed for use with monographic publications issued before 1801 and may also be applied to printed maps and music.

7.3 ISBD (CF) - Computer File

This is the most recent ISBD and the only one which has not been published in the earlier editions it has seven areas that covers edition statement, type and extent of files, area used for local access and remote access.

7.4 ISBD (PM) - Printed music

Printed music shares a number of characteristics of monographic publication and several rules are identical with those of the ISBD it has eight areas like statement, editions, areas of production, dates of production, publishers number.

7.5 ISBD (M)-Monographs

This was first developed primary for the use of national bibliographies which were still very largely concerned with the recording of monographs it covers other printed text materials for example broadsides.

7.6 ISBD (NBM) – Non Book Materials or Media

This covers all those materials which are not dealt with by the other specialized ISBDs it has five areas having the following information required equipment, multimedia items components, physical descriptions.

7.7 ISBD (S)-Serials

This deals with a pattern of publication its purpose is to ensure that a series statement matches the form that series would take if it were being described as serial in its own right. It has eight areas having areas, revisions, key titles, numbering area, physicals description, serials statement, notes, and standards number.

8.0 The advent of online catalogues

An online library catalogue;

SIR OTONDE MICHAEL AWITI

An online library catalogue is an electronic bibliographic database that describes the books, videotapes, periodicals, etc. in a particular library.

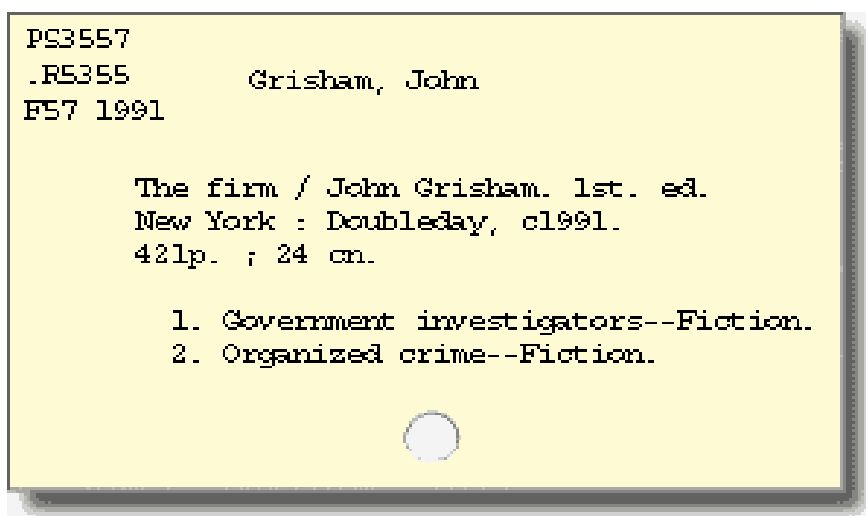

The online library catalogue evolved from a printed source, the library card catalogue. Before the advent of online catalogues, library catalogues were pieces of furniture that contained numerous small drawers. In these drawers were contained the records of particular items in the library.

These records were printed on small 3"X5" cards and each element of that record had an individual card produced for it. So for each item in the library there was:

- a card for the author
- a card for the title
- and cards for each individual subject heading

A copy of **John Grisham's book "The Firm"** might have four different cards filed in the different catalogue areas: one for the **author's name**, **one for the title**, and **one for each subject heading**, like those shown below:

You could only search one element at a time and this could take quite a bit of time from your schedule. Very few libraries in developed countries have card catalogues anymore.

Author card

SIR OTONDE MICHAEL AWITI

PS3557 The firm
.R5355
F57 1991

Grisham, John
The firm / John Grisham. 1st. ed.
New York : Doubleday, c1991.
421p. ; 24 cm.

1. Government investigators--Fiction.
2. Organized crime--Fiction.

Title card

PS3557 Organized crime--Fiction
.R5355
F57 1991

Grisham, John
The firm / John Grisham. 1st. ed.
New York : Doubleday, c1991.
421p. ; 24 cm.

1. Government investigators--Fiction.
2. Organized crime--Fiction.

Subject card No. 1.

PS3557 Government investigators--Fiction
.R5355

1. Government investigators--Fiction.
2. Organized crime--Fiction.

Subject card No. 2.

NB: A book or any other information resource or material could have more than one subject heading.

LESSON 8: Various Cataloguing Methods

8.1 Original cataloguing

Original cataloguing can be defined as a process whereby cataloguers prepare bibliographic records of information resources from scratch. It is done without the use of a pre-existing catalogue record for that information resource. Original cataloguing is also defined as creating a catalogue record for an item without the aid of an existing library record.

- It requires good training and apprenticeship; proficiency both in descriptive cataloguing and in subject cataloguing, and familiarity with the cataloguing tools.
- Original cataloguing is presumed to be tasking and requires intelligent and articulate persons with adequate skills, knowledge and experience.

8.2 Copy cataloguing

Copy cataloguing is defined as the adaptation of a pre-existing bibliographic record to fit the characteristics of the item being processed, “with modifications to correct obvious errors and minor adjustments to reflect locally accepted cataloguing practice” Copy cataloguing is mostly required for books that are difficult to catalogue and completely new books. However, for books that are already in existence in the library, application of ICT makes copy cataloguing easy as with Internet access and a click of a button/ mouse, information on the book or related books comes up and the cataloguer takes the required decision. Copy cataloguing can also be manually done with the aid of national bibliography and could be electronically carried out if the national bibliography is hosted online.

8.3 Online cataloguing

- **Online cataloguing** can be defined as the process of using bibliographic information stored in bibliographic utilities or online catalogues. It is a derivative of copy cataloguing. Online cataloguing and classification on the web have improved cataloguers work output as library resources are processed faster using appropriate software. Cataloguers who catalogue online do some modifications peculiar to their own library needs.

However, since there are many national publications that are not online, original cataloguing still becomes indispensable.

- Another form of online cataloguing is the use of other libraries Online Public Access Catalogue (OPAC) in cataloguing and classification practices. OPAC can be defined as a computerized library catalogue.
- Most libraries have made their OPAC accessible from a server to users and other libraries globally.

8.4 Human Input in Online Cataloguing

- Despite great advances in computer technology, computers still depend on human input. Computers can think faster, but they can't think with as much complexity as humans.
- Information and Communication Technology (ICT) has demonstrated its impact on library systems, services, operations, and particularly bibliographic control. ICT ensures easy integration of various library activities, increases efficiency in acquisition, cataloguing, classification, access to data, and information retrieval and dissemination.
- Online cataloguing saves the time of the staff and users. Application of ICT to cataloguing and classification enables effective bibliographic control, as information explosion experienced in the digital age has brought about creation of various kinds of publications such that users are faced with problems of how to identify and locate recorded knowledge as contained in books (printed and electronic), serials, databases, and other media that currently flood the book industry and the web.

Cataloguing involves two parts, which are **descriptive cataloguing and subject cataloguing thus;**

- Descriptive cataloguing entails providing bibliographic description using the elements available in the information resource to be described and being guided by choice of access points. The elements used in bibliographic description include the author, title, edition, place of publication, name of the publisher and date of publication, International Standard Book Number (ISBN) for books, or International Standard Serial Numbers (ISSN) for serials, among

SIR OTONDE MICHAEL AWITI

others.

- Through cataloguing, individual items are made to be unique from other items. In order to maintain international standards, descriptive cataloguing is carried out with the aid of Anglo-American Cataloguing Rules, second edition (AACR2), which is gradually being replaced by Resource Description and Access (RDA) in this digital age. Some libraries, mostly in developed countries have started using the Resource Description and Access (RDA) in place of AACR2 in cataloguing. Many national libraries like British Library, Library of Congress, National Library of Australia, National Library of Singapore, National Library of Malaysia and National Library of Philippines have implemented the RDA in their cataloguing practices.

8.5 Database Creation and Maintenance

The Bibliographic Database for Library Automation has to be created in such a way that it will last a life time regardless of the system software changes. It is important to note that System software and vendors come and go, hardware becomes obsolete, but a bibliographic database can survive for decades. A high quality, well maintained bibliographic file can be transferred from one generation of a system to another or migrated between successive systems from different vendors.

In addition to being the most lasting system component, if not properly constructed, the bibliographic database can also be the most limiting element of a multifunction integrated automated library system.

The bibliographic file creation and maintenance practices that will affect a library's ability to use various automated system capabilities, for both current and future applications.

Database Creation Options

SIR OTONDE MICHAEL AWITI

There are a number of ways of creating the bibliographic database to be mounted on a local automated library system. **Most approaches rely on a resource file of machine-readable records to provide cataloging copy, in preference to creating and keying all records from scratch.**

Cataloging resource files come in a variety of forms: a library database mounted on a local automated system, a CD-ROM stand-alone cataloging support system, or a remote file accessed via telecommunication linkages (such as OCLC - Online Computer Library Center which is a nonprofit membership organization that promotes cooperation among libraries worldwide. More than 54,000 libraries in 109 countries use OCLC services to locate, acquire, catalogue, lend and preserve print and electronic library materials).

The resource file is searched for a record that describes the item being cataloged. If an exact match is not found but the file contains a record for a similar item, a derived catalog record is created by selecting and editing the near-matching record to represent the item in hand.

If no copy record can be identified, an original record is prepared. It is important to know that all copy cataloging requires some editing so as to add local library-specific data such as call number or local subject headings. Record creation and record editing can be performed either on the system that supports the resource file or on the local automated library system.

The Importance of Adherence to MARC

- What may appear to be a reasonable time and labor saving variation from standard **MARC (the acronym for MACHine-Readable Cataloging)** may be **a deterrent when sharing data.** MARC defines a data format that emerged from a **Library of Congress-led** initiative that began nearly forty years ago.
- Other important data elements are standard numbers such as the Library of Congress Card Number (LCCN) and the International Standard Book Number (ISBN).
- Although often regarded as of little importance in local system databases, the above numbers assume significance in external applications, such as;

SIR OTONDE MICHAEL AWITI

- ✓ When a library is seeking to produce a microfiche or CD-ROM catalog;
- ✓ To migrate the database from one automated library system to another
- ✓ To merge its records with those from other libraries on a shared automated system; or to report holdings to a union catalog.

Appropriate Fields: Consistent Formats

- It is not enough to record data in the appropriate field. It must also be recorded in a consistent format.
- Some automated library systems and cataloging support systems enforce formatting consistency by providing input validation routines that either alert the operator to an incorrectly formatted number and prevent it from being added to the database, or automatically reformat the data once it has been keyed. However, most multifunction integrated automated library systems neither check nor manipulate input data; they accept whatever is keyed and output it unchanged.
- Appropriate and consistent formatting conventions must be followed if standard numbers are to be readily available for machine manipulation.
- Capabilities to support the output of MARC records emphasizes the need for libraries to expand their data entry horizons beyond the confines of any local system usage.

Correcting a Defective Database

- It is expensive to develop and maintain a bibliographic database, and the cost can escalate dramatically if ill-considered shortcuts result in records that cannot support the full range of automated library system applications, necessitating major revision or upgrade of the file.

N.B.:

A library can correct defective records by calling them up and changing them one at a time or, if the problems are widespread and consistent, it can contract with a

SIR OTONDE MICHAEL AWITI

bibliographic tape processing service to prepare custom software to correct the records automatically. Some automated library system vendors also provide these services. The more customization a vendor is required to perform to prepare a file for loading or transfer, however, the more the library can expect to pay for the service. It is therefore advisable to strictly adhere to the set international standards to avoid future inconsistencies and subsequent correction expenses.

8.6 How to Search in an Online Catalogue

- In order to get electronic databases to divulge their secrets, you have to know how to speak to them. Think of it as digital baby talk.
- You have to tell a computer if you want all the words of your search to appear in the results. You might also need to let the computer know which terms you don't want to appear in your results. One needs to devise a way of how to speak (search) to a database to get the best results for meeting ones or client's information needs.
- **The Various Search Types are indicated below;**

Basic search types	Search operators
Keyword Natural language Subject Heading Browsing thesaurus or index	Boolean operators Proximity operators Plurals Truncation Wildcards

LESSON IV

Database Searching Strategies and Techniques

8.0 Searching Strategies and Techniques

It is crucial that one is able to understand;

- The different elements in a library database record.
- The difference between a keyword search and subject search.
- How to use Boolean logic connectors in a search.
- How to use exact phrase searching.
- How to use truncation in a search.
- How to access and use library databases for finding articles.
- How to access the library databases from off-campus.
- How to locate full-text articles using the Search Journals tools.
- How to request articles from other libraries through Inter Library Loan service (ILL).

8.1 Database Searching with Boolean Operators

To get the best results, it is important to search your topic in a way that the database will understand. While database search interfaces can look very different, most of them use the same commands to state the relationship between search terms. These common commands are known as **Boolean operators**.

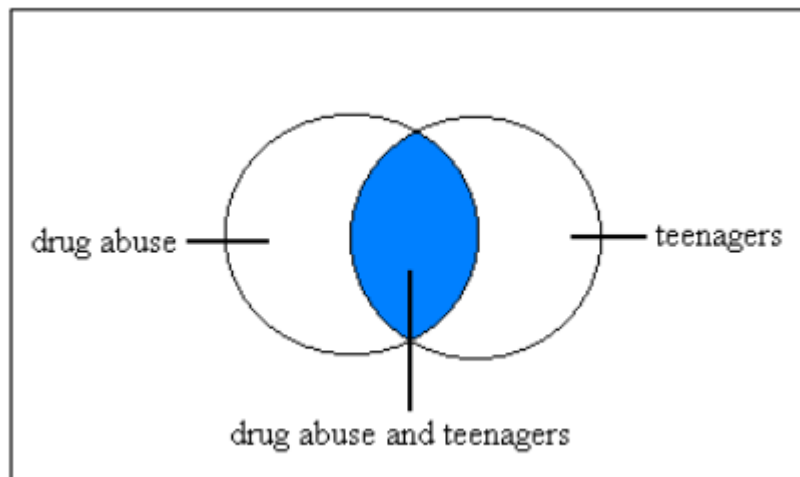

The Boolean operators **AND**, **OR**, and **NOT** tell the database how to group your search terms and in what order to search for each term. They can be used individually to join two terms, or they can be used in combination, to create more complex search statements. Note that some databases require you to put the Boolean operators in uppercase letters (e.g., PubMed).

In the examples below, the area shaded in blue indicates the results that would be retrieved by each search statement.

AND is used between keywords with different meanings. AND will **narrow** a search.

Example search statement: drug abuse AND teenagers:

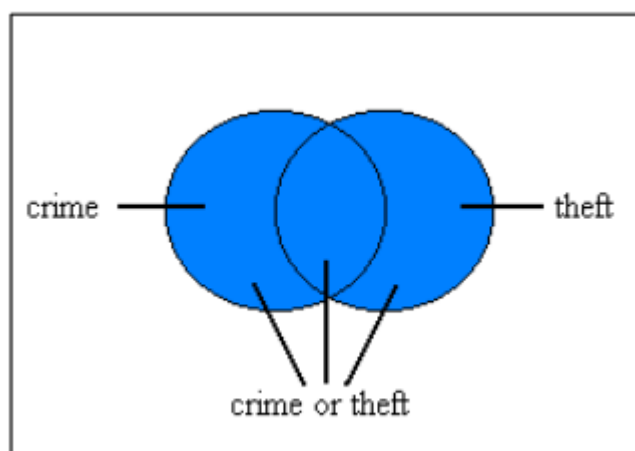

SIR OTONDE MICHAEL AWITI

This search retrieves only item records that contain **all** of the words entered. That is, both the words "drug abuse" and the word "teenagers" must be present in the same record.

OR is used between keywords that are similar or related in meaning. OR will **broaden** a search.

Example search statement: crime OR theft

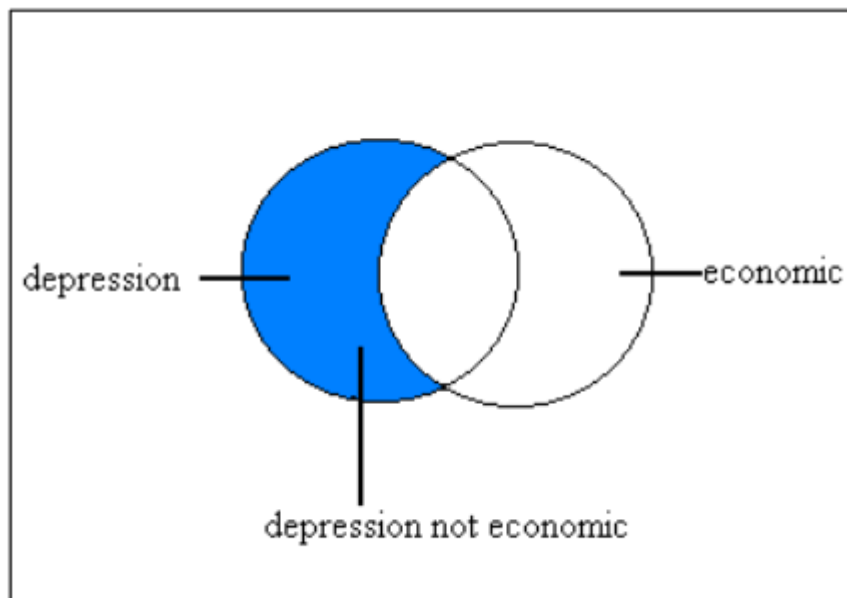

SIR OTONDE MICHAEL AWITI

This search (crime or theft) retrieves records that contain **any** of the words entered. The records may contain either the word "crime" or the related word "theft" and possibly (but not necessarily) both. As you can see by the shaded area, using OR increases the number of search results you will get.

NOT is used to **exclude** concepts from a search. For example, if you wanted information about mental depression, a simple keyword search for "depression" would retrieve many results. Some results would deal with mental depression, but others might be about such topics as economic depression. To eliminate these unnecessary results, you can use the Boolean operator NOT. (Note: Some databases use AND NOT.)

Example search statement: depression NOT economic

SIR OTONDE MICHAEL AWITI

As you can see by the shaded area above, this search would retrieve documents that contain the word "depression." Of these documents, however, the computer would eliminate any that also contain the word "economic." NOT should be used sparingly, however, as you may unintentionally eliminate useful documents from your results when you use it.

8.1.1 Combining Boolean Operators

You can use Boolean operators to combine related terms to do a more complex search rather than having to do multiple searches using variations on the words that best express the key concepts in your topic.

If using both AND and OR in a search, you must also use brackets (parentheses) to group together synonyms or related words for the same concept. This clarifies in what order to execute the search. Otherwise the database may not be able to interpret your search and you might get no results at all.

Examples: crime AND (workplace OR employment)
(crime OR theft) AND (workplace OR employment)

8.2 Truncation or Stemming in Literature Searching

Truncation is the act or process of shortening or reducing something. In the context of literature searching, it refers to the shortening of a search term so as to bring up words that share a root word but have different endings. For example: If the **truncated or shortened search word is “laugh”, the computer will search for results containing laugh, laughter, laughing etc.**

8.2.1 Truncation in searching process

To instruct the computer to truncate a word, **a symbol is added to the end of the root of a word to instruct the database to search for all forms of a word.** The asterisk (*) is used in many databases for truncation. In the root word laugh noted above, an asterisk would be added so that the computer can be able to find all possible articles to

SIR OTONDE MICHAEL AWITI

do with laughing. The word laugh* with an asterisk at the end will give results of any articles where laugh, laughter, laughing is discussed.

The frequently used truncation/ wildcard symbols include:

- The asterisk (*)
- A question mark (?)
- A dollar sign (\$).
- An exclamation mark (!)
- A hash tag (#)

NB:

Truncation and wildcard symbols vary by database. Check the help screens to find out which symbols are used. It is also important to know that placing the **truncation or wildcard symbol** in a word too soon might be counterproductive. Truncation is encouraged when there is need to broaden the search so as to increase the number of references.

Examples of other words that can be truncated include:

- **Music***, computer will search: **musical, musician, musicians and musicality**
- **Sun***, the computer will search: **suns, sunshine, sunny, sunlight**
- **Child***, the computer will search: **child, child's, children, children's, childhood**
- **Genetic***, the computer will search: **genetic, genetics, genetically**

8.3 Wildcards:

Similar to truncation, wildcards substitute a symbol for one letter of a word.

- This is useful if a word is spelt in different ways, but still has the same meaning.
- Examples:
wom!n = woman, women
colo?r = color, colour

9.0 Evaluation and Use of information

When evaluating either print or online resources for a research assignment or paper, one needs to ask the following questions from the evaluation criteria checklist below:

SIR OTONDE MICHAEL AWITI

Evaluation Criteria Checklist

Author/Authority	• Who is the author or sponsoring organization? • Who is the publisher? • Is there contact information? • Are the author's credentials provided? • Is biographical information given?
Bias	• Why was the work written? • Does the author or sponsor have an agenda? • Is there an <i>About</i> link? • Is the site personal, commercial, governmental, organizational, or educational? (.com, .gov, .org, .edu) • Who is the target audience? • Is the information intended to inform, explain, sell, promote, or persuade?
Content/Currency	• Currency: what is the publication date or last revision? • Is the source comprehensive, brief, or unique? • Is the material presented as original or secondary? • What level is the presentation? (elementary, HS, college) • Does the author support the information with works cited or links to other sources?
Design	• Is the website user-friendly? • What kinds of images are used? • Is the navigation menu well-labeled? • Are there spelling or grammar errors? • Do the pages appear uncluttered? • Are there ads or pop-ups on the page? • Are links working?

LESSON 10: Management and Quality Control in Cataloguing

10.0 Management and Quality Control in Cataloguing

Quality cataloguing implies application of standards or rules of cataloguing to cataloguing practice.

- It requires emphasis on maintenance of cataloguing rules.
- Quality control involves attention to all positions in cataloguing department even to the lowliest, as quality work in one area can be negated by sloppiness in another, for example careless inputting of data.
- The Anglo- American Cataloguing Rules (AACR 2) and presently Resource

Description and Access (RDA) need to be used for standardization in bibliographic

description of information resources.

- Library of Congress Classification Scheme; Dewey Decimal Classification Scheme, Bliss Bibliographic Classification Scheme; Colon Classification Scheme; and Elizabeth Moys classification scheme for law books, among other classification schemes emerged as a result of the quest to maintain standard in classification of information resources.
- In order to have uniformed system of representing bibliographic features of any information resource, different subject heading lists emerged, and the most popular ones are the **Library of Congress Subject Heading List** and **Sears**

List of Subject Headings, and each is used depending on the classification

system adopted by a particular library.

NB:

All the above noted efforts are geared towards making information resources easily accessible and retrievable in order to serve the clientele better and faster.

10.1 Thesaurus: Definition

SIR OTONDE MICHAEL AWITI

- Derivationally the word thesaurus originated from the Greek language and symbolized the concept of treasury or storehouse of knowledge. The Webster's dictionary has defined it as, '**a useful literary collection or selection especially a book of synonyms and antonyms.**'
- The UNESCO has defined the thesaurus as, '**a vocabulary of controlled indexing language formally organized so that the a priori relationships between concepts (e.g., 'broader' and 'narrower') are made explicit**'
- A thesaurus is chiefly a terminological control device for transformation of natural language (NL) expressions, used by authors, referees, publishers, indexers and users who form the various links in the information transfer chain into a more constrained system of vocabulary
- A compilation of words and phrases showing synonyms and hierarchical and other relationships and dependencies, the function of which is to provide a standardized vocabulary for information storage and retrieval systems.
- A thesaurus is used **to find words that are interesting to use in place of other words** and is used to make texts that are more interesting. It is used to identify vocabulary that is interesting to utilize in place of other words and is employed to create texts that are more engaging.
- **Functionally a thesaurus is** a terminological control device used in translating the natural language into the systems language. **In any information storage and retrieval system (ISRS), indexing plays an important role. An index describes the**

10.2 Purposes of Thesaurus:

The purposes of the thesaurus are;

- To provide a map of a given field of knowledge.
- To provide a standard vocabulary for a given subject field.
- To provide a system of references between terms.
- To provide a guide for users of the system.
- To locate new concepts in a scheme of relationships with existing concepts in a way which, makes sense to users of the system.
- To provide classified hierarchies.

SIR OTONDE MICHAEL AWITI

- To provide means by which the use of terms in given subject field may be standardized.
- The thesaurus can also be used for generation of keyword lists
- The thesaurus is also useful in computer-assisted indexing and abstracting.
- Thesaurus helps in defining terms.
- The thesaurus plays a vital role in retrieving relevant information from an Information Retrieval (IR) System.

10.3 Browsing a Thesaurus or Index

Some databases let you search the subject headings directly. A list of subject headings used in a particular database is often referred to as a thesaurus. They are available through the index or subject search tools. The index displays an alphabetical list of subject headings used in the database. However, some databases have sophisticated thesauri that provide cross-references. For example, if you type in "death penalty," the thesaurus might have an entry that tells you to use "capital punishment" instead. Some thesauri also include a description of the term, and a list of broader, narrower, and related terms.

10.4 Deciphering your results

The results you get from your search depend on the type of database you are searching.

- A **bibliographic database** provides a citation which is a basic description of an article. This usually includes the title of the work, the author, the publisher, the date, the original source, the city of publication, etc., according to the type of item being cited (e.g. book, magazine article, World Wide Web site, etc.)
- A bibliographic database may also provide an abstract - a short summary of the contents of an item in a database.
- A **full-text database** will display an article in its entirety. Full-text articles can appear as HTML documents, in which all the words that appeared in the original print format are offered to you online, or as PDF documents, which show each page as it appears in the print journal or magazine. Non-textual material such as pictures and charts are not always included.

LESSON 11: Authority Files

11.0 Authority files or Controlled Vocabularies

- Authority files contain names and subjects that can be added to catalogue records to simplify searching by providing a consistent vocabulary for access points. The specialized scope of most authority files means that libraries and archives often rely on several vocabulary sources.
- A controlled vocabulary or an authority file is a limited set of **consistently used and carefully defined words or phrases** that have been pre-selected by the designers of the controlled vocabulary, in contrast to uncontrolled vocabularies where there is no restriction on the values that can be used.
- Controlled vocabularies enable librarians to provide uniform access to materials in library catalogues and to provide clear identification of authors and subject headings. **For example, works about ‘movies’, ‘motion pictures’, ‘cinema’, and ‘films’ are all entered under the established subject heading ‘motion pictures’ (Library of Congress Authorities, 2008).**
- Conducting a search in a database that uses controlled vocabularies or indexing terms is more efficient and precise. Once a correct term is found, most of the relevant items are returned for a single search, meaning that there is no need to search for all the other synonyms for that term.
- Without basic terminology control, inconsistent or incorrect metadata can profoundly degrade the quality of search results. **For example, without a controlled vocabulary, ‘candy’ and ‘sweet’ might be used to refer to the same concept.**
- Controlled vocabularies may also reduce the likelihood of spelling errors when recording metadata

11.1 Authority control maintenance

Authority control is maintained by means of authority files (discussed above) which record the correct form of headings (for example, personal name headings). **The point of authority control is that if catalogues are to help users identify information resources, there needs to be consistency, particularly in the case of popular**

SIR OTONDE MICHAEL AWITI

access points such as author, title and subject description. If cataloguers are to provide an effective service, they must ensure, for example, that if users search for resources by a particular, known author, the system will retrieve all records relating to the author's work and not just some of them. **Authority files, therefore, have a function similar to thesauri. A thesaurus is in fact a form of authority file which provides a list of preferred and non-preferred subject terms, with linkages between preferred and non-preferred terms, between broader and narrower terms and between related terms.** Where authority files differ from thesauri is that they are a guide to preferred and non-preferred vocabulary for a range of fields, whereas thesauri specifically control vocabulary in subject fields. National libraries are often a source of authority files: for example, personal name and corporate name file listings.

Authority files may function in much the same way as thesauri, that is, as listings to which cataloguers refer, but in library management systems, they may be more than this. Certain types of data, such as authors' names, may be stored only once in a system, in an authority file separate from the main bibliographic file. In fact, some data elements in the bibliographic file, for example, personal names, corporate names, titles, series titles and subject headings may be drawn from discrete authority files in order to construct and present a bibliographic record. **Each authority file (for example, author authority file) would in that case list preferred terms, along with relations (for example, non-preferred terms) and pointers to those bibliographic records which 'contain' the terms.** The pointers are often system-generated bibliographic record numbers which appear in both files. As well as using authority files for access elements, such as author and title, the cataloguing system may also maintain an authority file for other data elements, such as publishers' names.

Features of authority control include:

- Automatic creation of an authority file entry when a new heading is created or imported with a new catalogue record
- Automatic deletion of references when the last catalogue record with which they are linked is deleted

SIR OTONDE MICHAEL AWITI

- Ability to import authority file terms from an external source, for example, the integration of Library of Congress Subject Headings with local systems.
- Ability to establish a reference structure among authority file headings
- Global change facility, so that, for example, when country's name changes all instances in the subject authority file of the old name can be changed to the new one, with an appropriate reference from the disused name
- Ability to merge authority file headings, for example, where two entries in the author authority file are for the same author
- Easy navigation between cataloguing procedures and authority files
- Listing of new and dropped authority file terms, for cataloguers to review

The ease with which cataloguers can move between catalogue creation and authority files has not always been satisfactory, but the use of windows presents cataloguers with the opportunity to check authority files while in the middle of entering catalogue data. Many software packages now allow the operator to split the screen into a number of boxed areas or windows and run more than one application simultaneously (or at least display more than one application and run one of them). For the cataloguer this means being able to access authority files while creating records, instead of having to leave the record creation application. A similar facility should be available if the cataloguer is editing records.
